Dropcheck

Pre-flight checks for token distributions

Portaldot Hacker House 2026
Track 4: Ecosystem DApps

A valid address can still fail

Tokens arrived.
The balance was unusable.

A community member reported DED tokens stuck on Asset Hub because the receiving account lacked native DOT.

For token issuers, recipient readiness belongs in the send workflow.

Source: Polkassembly post #2364. Dropcheck prevents future Portaldot transfer issues.

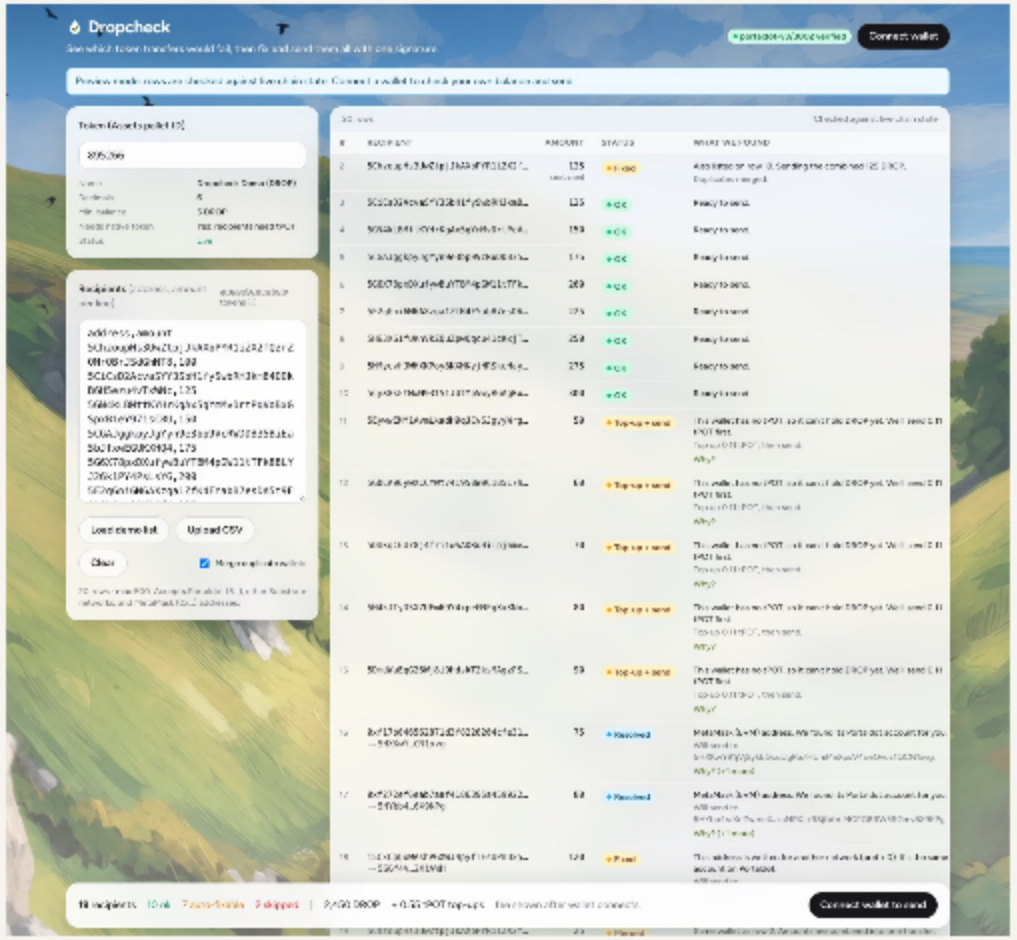

Checks before the signature

Load a recipient list

Paste addresses and amounts
or upload a CSV.

Review each proposed fix

Merge duplicates, resolve addresses
and add native-token top-ups.
Blocked rows stay out of the batch.

Portaldot provides the execution model

Assets pallet	Native tokens with minimum-balance and account rules.
Balances pallet	Fund a fresh recipient before transferring the asset.
Utility.batch_all	Top-ups and transfers succeed or fail together per batch.
Revive address mapping	Resolve MetaMask addresses to native Portaldot accounts.

One signature per batch. No custom smart contract.

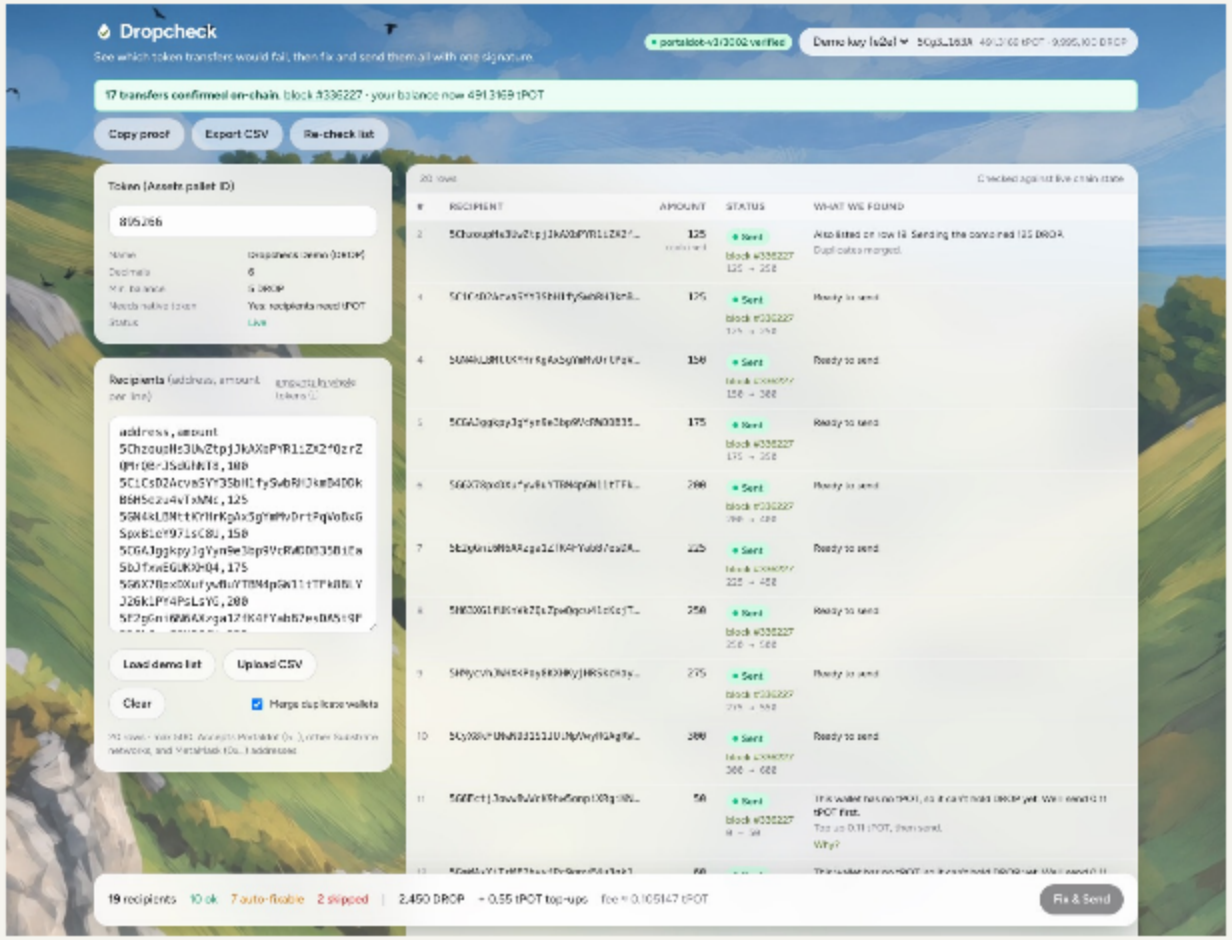

A batch confirmed on the live testnet

17

token transfers

5 native top-ups
1 signed atomic batch

Block #336227

Recorded testnet run. Browser automation used an injected signer.

The working build

Browser implementation

Next.js, React and TypeScript
polkadot.js WebSocket connection
Wallet signs without exposing keys
Static hosting, no backend

Verified behavior

Live recipient checks and address mapping
Signed-transaction dry-run failures
17 transfers in one batch
55 recipients across two batches

Before final submission

Real extension sends and a final deployed-app regression check remain.
The manual-workflow timing baseline is not yet measured.

Continued support funds real usage

A focused tool for Portaldot token issuers

Next: validate real wallets, run issuer pilots, and measure how many problematic rows the checks catch before signing.

Support priorities

Wallet compatibility and node reliability
Pilot feedback and distribution evidence
